

Battery Pickup/Energy Components

Daniel Monks

- Intention / Justification:
 - Provides a resource that can be used to power multiple systems, with flexibility that allows the player to choose how they wish to do so for example powering a platform or opening a door
 - Is intuitive as the concept of energy is widely understood
- Technical Spec:
 - Represented visually by cylinders arranged to form a battery
 - When picked up, the battery pickup provides adds to the energy value in the energy component of the player
 - The player and all other entities have a store of 5 energy at maximum
 - Energy is used like ammo for energy-based guns
 - The energy gun is an example that uses the player's energy value as ammunition to transfer energy from them to another object or entity that also uses energy, powering them
 - Energy is spent in this way to power level elements such as doors, platforms and more
 - Energy now replaces stamina as the resource for sprinting, adding to the value choice made when deciding to use it or not
 - Battery pickups can be found in the level or obtained as a loot drop from destructible level elements
 - Energy is also drainable/obtainable from a variety of level elements
 - Examples include renewable sources in case the player wastes energy and needs to find more, such as generators and renewable sources of destructible crates on conveyor belts
